EchoGuard

Four-minute speaking script | Manual slide advance

SLIDE 1 • 00:00–00:15 | 15 seconds

Imagine hearing a familiar voice asking for money. Would you trust the voice, the message, or neither? EchoGuard helps you pause and investigate. Our promise is simple: hear the voice, uncover the risk.

Cue: Pause after the opening question. Click once to move to the problem.

SLIDE 2 • 00:15–00:45 | 30 seconds

Scams are bigger than fake voices. A caller may sound convincing, create urgency, and then ask for money or an authentication code. Students face internship fees; others face banking or investment scams. A natural voice can still deliver a harmful request. We need to examine the voice, the demand, and community context separately.

Cue: Read only one of the three short quotes aloud. Emphasize “separately.”

SLIDE 3 • 00:45–01:10 | 25 seconds

This is the actual EchoGuard interface. Upload an authorized recording, paste a message or manually obtained transcript, or search a phone number. These are independent workflows. We do not automatically transcribe audio or combine results into a scam percentage. Each feature explains what its evidence can and cannot tell us.

Cue: Point briefly to the three feature labels, then to the real interface image.

SLIDE 4 • 01:10–01:50 | 40 seconds

Consider this message: pay nine hundred and ninety-nine rupees today to secure an internship, or the offer expires. EchoGuard flags the payment demand and pressure, with the actual text as evidence. We also fixed a logic gap: guaranteed investment profits previously returned a low assessment because no rule matched. The expanded engine covers broader scam categories and distinguishes common safety advice and incomplete inputs. This is an explainable rule-based assessment, not a trained AI model or proof of fraud.

Cue: Use this as the main demonstration. The screenshot is a real local result, not a mocked provider response.

Rehearse once with a timer. Pause naturally. Voice outcomes are documented possibilities, not live results.

SLIDE 5 • 01:50–02:20 | 30 seconds

The voice adapter sends recordings to the official DetectifAI endpoint. We verified its authentication, upload format and response schema. The interface preserves real, fake and not-sure outcomes without turning them into a scam verdict. Keys stay on the server, and EchoGuard does not permanently store recordings. A real account detection test still needs a configured key and credits.

Cue: These are possible documented outcomes, not claims of live detection results. State the credential limitation once, clearly.

SLIDE 6 • 02:20–02:55 | 35 seconds

Users can search a number or report an experience without providing their name. Search shows category totals and the latest report date; descriptions stay private. PostgreSQL preserves reports across application restarts. Duplicate handling and persistent limits reduce abuse. Reporting passed a real local database test; a hosted database still needs configuration. These are unverified submissions: counts do not identify a scammer, and no reports does not mean safe.

Cue: Avoid inventing sample counts. Emphasize persistence and the unverified-report notice.

SLIDE 7 • 02:55–03:30 | 35 seconds

Our architecture connects the browser to an Express API, local text rules, DetectifAI and PostgreSQL. Inputs are validated, and service errors never become safe assessments or empty searches. Seventy-six automated tests passed, plus browser and automated accessibility checks. Database tests verified duplicates, aggregation, rate limits and persistence after an application restart. These checks demonstrate implemented behavior, not detection accuracy. Live provider and hosted database setup remain.

Cue: Point to the architecture first, then the verified-versus-next distinction. Do not call the project fully production-ready.

SLIDE 8 • 03:30–04:00 | 30 seconds

EchoGuard turns a rushed reaction into an informed pause. Users get three evidence trails: voice authenticity, text warnings and community-reported activity. Text analysis already works independently. Next, we will configure live services, verify real requests and pilot responsibly. We cannot prove safety, but we can help people ask better questions before they trust, pay or share. Thank you.

Cue: End on the tagline. Leave this slide visible for questions.

Rehearse once with a timer. Pause naturally. Voice outcomes are documented possibilities, not live results.
